Summary Results of the Urban and Rural Household Income and Expenditure Survey -The Year 1400¹ (20 March 2021 - 20 March 2022)

^{1.} It is the Iranian year which usually begins on the day of 21 March of Gregorian calendar. To find the corresponding year of Gregorian calendar, add 621 or 622 (depending on the time of the year) to a <u>solar Hijri</u> year. For example, the corresponding year of the year 1400 in Gregorian calendar is (21 March 2021-20 March 2022).

Preface

The Households Income and Expenditure Survey (HIES) has been implemented since the years 1342 and 1347 in rural and urban areas, respectively. As of the year 1353, the income data were collected in addition to the data of household expenditures. The HIES general aim is to estimate the average income and expenditure for urban and rural households at provincial and country levels. The importance of this survey is to provide the opportunity to review the consumption trend of goods and services, to study the interrelationships of socio-economic characteristics of households, to assess the effects of economic policies on social justice provision and the distribution of income, to study the households below the poverty line and finally its important role in providing the information and data needed for national and regional accounts, especially in social and economic studies and planning. The definitions and concepts of this survey comply with the System of National Accounts (SNA) and the classification of the questionnaire items used was based on the Central Product Classification (CPC) and then on the Classification of the Individual Consumption Purpose Classification (COICOP).

With respect to the necessity of estimating changes in the Urban and Rural Households Income and Expenditure Survey, the rotational sampling and master sample were used in this survey. The master sample is a large sample from which sub-samples can be selected to meet the needs of several surveys or several periods of a regular survey. In regular surveys, the use of the master sample, while being cost-effective, makes the executive operations and overlapping of samples be better controlled at different periods of the survey. Considering the creation of the fourth master sample for household surveys based on the results of the Population and Housing Census of the year 1395, the fourth master sample of the household surveys was used to provide the samples for the survey in the year 1400.

The HIES of the year 1400 has been implemented on the basis of a sample of 19618 households in urban areas and 18370 households in rural areas.

The survey detailed results, including 234 tables in two separate publications by urban and rural areas, are annually released by the Statistical Centre of Iran. Also, the detailed results of the survey which are presented in 512 tables, including the most detailed data and information for 31 provinces and total country are available to the interested users, planners and researchers by the Dissemination Section of the Statistical Centre of Iran.

The HIES target population includes all private settled and collective households in urban and rural areas. The sample households are selected from 387 and 395 sub-provinces in urban and rural areas across the country¹, respectively.

Samples of this survey are selected in three stages by using probability sampling methods. In the first stage, the sample clusters in each class of the master sample are systematically selected. In the second stage in each sample cluster, six-household rotation groups are formed and three rotation groups, based on the rotation pattern, are determined for each year. In the third stage, within each rotation group, two households are randomly selected as the main sample households and the remaining four households in the rotation group are considered as replacement households.

¹. Based on the latest administrative divisions, until the end of the year 1395, there were 31 provinces and 429 subprovinces (Shahrestan) in the country.

According to the objective of the survey, the number of samples is optimized in order to estimate the average annual income and expenditure of a household. To obtain estimates as a better representative of the entire year, samples are distributed among the months of the year for the survey.

Types of Expenditures of an Urban and Rural Household

In the year 1400, households in urban areas spent, on average, 925,017 thousand rials for shopping and using consumer goods and services representing a 48.9 percent increase compared with the results obtained in the previous year.

The average expenditure of rural households in the year 1400 was 519,119 thousand rials showing a 52.4 percent increase compared with the previous year.

4. COMPOSITION OF ANNUAL EXPENDITURES OF AN URBAN HOUSEHOLD,

5. COMPOSITION OF ANNUAL EXPENDITURES OF A RURAL HOUSEHOLD,

Types of Incomes of an Urban and Rural Household

Based on the results obtained in the year 1400, the average annual income for an urban household was 1,124,217 thousand rials, and 637,132 thousand rials for a rural household showing a rise of 50.5 and 51.5 percent compared with the previous year, respectively. In this year, income from the wage and salary occupations, income from self-employment in agricultural and non-agricultural jobs, and unearned incomes at urban level increased by 55.9, 59.0, and 44.8 percent, respectively compared with the previous year. Besides, income from the wage and salary jobs, income from self-employment in agricultural and non-agricultural jobs, and unearned incomes at rural level grew 56.6, 59.0, and 41.1 percent, respectively compared with the previous year. The share of every income source in the total urban income is: 32.6% from wage and salary jobs, 16.5% from self-employment in agricultural and non-agricultural jobs, 50.9% from unearned sources, and the share of every income source in the total rural income is: 33.9% from wage and salary jobs, 31.2% from self-employment in agricultural and non-agricultural jobs, and 35.0% from the unearned sources.

1400	1,124,217	50.5	637,132	51.5	

5. Household income includes 3 parts: wages and salary jobs, self-employment in agricultural and non-agricultural jobs and unearned. Household unearned income is derived from 4 main sources, including (1) retirement pension, (2) estimated rental of personal housing (the rental cost estimation of the housing owned by household which is included in both expenditure and income. It is noted that whenever a household rents a property for income, it is not included in this section ,but it is included in other unearned sources of income.), (3) household cash subsidy, and (4) other sources of income earned from saving account, scholarships, rental income from housing, garden, land and etc,.

TOTAL ANUUAL EXPENDITURE OF AN URBAN HOUSEHOLDS

TOTAL ANUUAL INCOME OF AN URBAN HOUSEHOLDS

TOTAL ANUUAL EXPENDITURE OF A RURAL HOUSEHOLDS

TOTAL ANUUAL INCOME OF A RURAL HOUSEHOLDS

Definitions and Concepts

Gross Expenditure:

Is the Rial value of spending on goods and services which are consumed by the households for themselves, other households, government, and non-government organizations. It includes consumption and non-consumption expenditures. Saving, loan, loan repayments, and payment for other financial transactions are not included in household expenditure.

Net expenditure:

In this survey, when the selling value of the second-hand goods is subtracted from the household expenditure, it is called the "household net expenditure"; otherwise it is called the "household gross expenditure".

Income:

Is all sums and value of goods and services at rial received for the job done or capital invested or from other sources (retirement pension, income from assets/properties, transferred receipts...) by the household members. Accidental incomes from the institutes and institutions such as insurance claims are included in household miscellaneous income.

Transferred receipts of household are the funds that are paid to a household by institutes, institutions, public, private, social, and charity organizations, and other households (including financial contributions, charitable donations, allowances...).

Gini Coefficient:

One of the income inequality measuring indices is Gini Coefficient. This indicator is a figure between zero and 1 (or zero and 100 percent), in which the zero reflects complete income equality or wealth distribution and 1 reflects the absolute inequality in income or wealth distribution.
