

A Selection of Labor Force Survey Results

Winter, the year 1401¹ (22 December 2022- 20 March 2023)

1. It is the Iranian Year which usually begins on the day of 21 March of Gregorian calendar. To find the corresponding year of Gregorian calendar, add 621 or 622 (depending on the time of the year) to a solar Hijri year. For example, the corresponding year of the year 1401 in Gregorian calendar is (21 March 2022- 20 March 2023).

Iranian seasons and their equivalent in Gregorian calendar

Spring (21 March-21 June)

Summer (22 June -22 September)

Autumn (23 September -21 December)

Winter (22 December -20 March)

A Selection of Labor Force Survey Results, Winter, the Year 1401

Introduction

The pair concepts of employment and unemployment are so basic to national economies that any rise in the employment rate, which means a drop in unemployment, is reckoned as an indicator of national development. The unemployment rate is an indicator for appraising the national economic conditions. The information on the nation's market is collected through the Household Employment and Unemployment Characteristics Survey (HEUCS) as of the year 1376. However, in order to improve the HEUCS quality and its conformance with international concepts, particularly, with those of the ILO, the survey plan was revised so that the current plan namely "Labour Force Survey" could be implemented. The "Labour Force Survey" was first conducted in the year 1384, and since then has been regularly taken in the middle month of every season.

The "Labour Force Survey" is conducted to get information on the composition and the current condition of the labour force and its changes. This aim is accomplished by "estimation of seasonal and annual labour force indicators at national and provincial levels", "estimation of the annual number of the labour force at national and provincial levels", "estimation of seasonal and annual changes in the labour force at national and provincial levels", and "estimation of annual changes in labour force indicators at provincial levels".

The population covered in this survey includes the people who, according to the definition, are members of private or collective settled households in rural or urban areas, so the members of private unsettled households and institutional households are not included in this survey. The method used for conducting this survey is a two-stage classified clustering method. In this survey, in addition to the estimation of current levels, the estimate of changes is made; therefore, the rotation sampling is used. The rotation sampling can provide the estimate of current levels and changes in the best manner by fixing some sample units between two quarters of the survey and changing the remaining units. With respect to the aim of the survey, the selected rotation pattern for this survey is a "2-2-2" pattern which means that during the Master Sample period, each sample household is enumerated four times; accordingly, that sample household is in the sample for two successive quarters and then is excluded from the sample temporarily for two successive quarters and again is included in the sample for the two next successive quarters. This household is then excluded from the sample until the end of the years related to the master sample period. It should be noted that for optimal conduct of rotation sampling, the master sample is needed. The master sample refers to the sample that can be used for the selection of sub-samples to satisfy the needs of several surveys or several rounds of a survey. The sampling frame of the first stage (from the spring of the year 1397) is the fourth master sample of the household surveys. The master sample includes the sampling units (clusters) of the first stage. Each cluster includes one block/village, part of a large block/village, or in some cases a combination of some small blocks/villages which were created from the 2016 National Population and Housing Census. With respect to the changes in population and housing units in urban areas and in order to prepare an appropriate and updated frame in urban areas, some households were listed within the master sample clusters in the winter of the year 1400, but due to minor changes in population and housing units in rural areas, no listing was made in rural areas (unless in exceptional cases).

It should be noted that since the spring of the year 1397, the confidence interval for the unemployment rate has been 95 percent in the release of the Survey results. In view of the statistical methodology, the confidence interval means that if several samples are selected from the target population by using the same sampling method, and based on each of the samples, a confidence interval is calculated for the real unemployment rate. It is expected that 95% of these confidence intervals include the real unemployment rate.

A Selection of Labor Force Survey Results, Winter, the Year 1401

It should be mentioned that according to the studies conducted, due to social changes in the entry age into the labour market in recent years in different countries, the minimum age at 15 has been considered for reviewing key indicators of the labour market. Due to similar changes in our country, the major indicators of the country's labour market have been calculated and presented based on the population aged 15 and over since the spring of the year 1398.

Findings

Based on the results of this survey for the winter of the year 1401, major indicators of the labour market and its changes in this season compared to the winter of the year 1400 are presented in Table 1. Besides, table 2 shows the major indicators of the labour market by province. Figure 1 provides the major indicators of labour market in the winter of the year 1401.

Figure1. Major Indicators of Labour Market in the winter of the Year 1401 (1000 persons)

A review of the economic participation rate for the population aged 15 and over (activity rate) reveals that 40.5% of the population at working-age (15 years and over) are economically active; i.e., they lie either in the employed or the unemployed group. In addition, the results indicate that the economic participation rate stands higher for men compared to women, and rural areas in contrast to urban areas. The review of the trend of changes in national economic participation rate shows that this indicator increased by 0.1 percent compared to the corresponding season of the previous year (winter of the year 1400). The study of the employment rate of the population aged 15 and over shows that 36.6 percent of the working-age population (15 years and over) was employed. This indicator stands higher for men and rural areas compared to women and urban areas.

-The difference between the total number of employees and the summation of employees in the three sectors is due to the unannounced (not stated) figures in the major sectors of economic activity.

- The difference is due to rounding.

1. The target population of the labour force survey is the people at working age from private settled and collective households in urban and rural areas.

A Selection of Labor Force Survey Results, Winter, the Year 1401

A review of employment in major economic sectors indicates that the services sector holds the biggest share of employment with 53.7% of the total, followed by the manufacturing sector with 33.2% and the agriculture sector with 13.0%. In the winter of the year 1401, the contribution of the employed people to the agriculture and manufacturing sectors declined by 1.5 and 0.4 percent, respectively. The contribution of people employed to the services sector increased by 1.8 percent compared to the corresponding season in the previous year (winter, the year 1400).

A review of the unemployment rate among the population aged 15 and over shows that 9.7 percent of the economically active population was unemployed. Moreover, based on the confidence interval of 95%, the total national unemployment rate was between 9.3 and 10.2 percent with an 9.7 percent point estimation. This means that this interval with the confidence of 95 percent covers the national real unemployment rate. Based on the results, the unemployment rate was higher for women and urban areas than men and rural areas. A review of the trend of changes that happened in the indicator at the national level shows that this indicator experienced a 0.3 percent rise compared to the corresponding season in the previous year (winter, the year 1400).

Studying the unemployment rate among the youths aged 15-24 indicates that 24.2 percent of the economically active population at this age group was unemployed. This indicator stands higher for women and urban areas than for men and rural areas. A review of the trend of the changes in the national unemployment rate among the youths aged 15-24 shows that the indicator increased by 1.1% from the corresponding season in the previous year (winter, the year 1400).

The unemployment rate among the 18-35 age group indicates that 17.4% of the active population aged 18-35 was unemployed. This indicator stands higher for women and urban areas than men and rural areas. A review of the trend of the changes among the 18-35 age group shows that this indicator experienced a 0.8% rise compared to the corresponding season in the previous year (winter, the year 1400).

Reviewing the unemployment rate among the higher education graduates aged 15 and over shows that 12.8 percent of the active population among higher education graduates was unemployed. This indicator stands higher for women and rural areas than men and urban areas. A review of the trend of the changes suggests that this indicator dropped by 0.2% in the winter of the year 1401 compared to the corresponding season in the previous year (winter, the year 1400).

The underemployment share tells that 9.5% of the total employed population was underemployed. The indicator stands higher for men and rural areas than for women and urban areas. The underemployment share in the winter of the year 1401 experienced a 1.2 percent decrease compared to the corresponding season in the previous year (winter, the year 1400).

A Selection of Labor Force Survey Results, Winter, the Year 1401

Studying the contribution of the employed population aged 15 and over with the usual working hours of 49 hours and over shows that 35.6% of the employed people typically work 49 hours and over per week. This indicator, which is one of the decent work indicators, illustrates that a large share of the employed population works more than the standard hour. This indicator experienced a 1.1% decrease compared to the corresponding season in the previous year (winter, the year 1400).

In the winter of the year 1401, the share of unemployed higher education graduates out of the total unemployed population was 37.2 percent. The indicator stands higher for women and urban areas than for men and rural areas. A review of the changes shows that this indicator experienced a 0.9 percent fall compared to the corresponding season in the previous year (winter, the year 1400).

In the winter of the year 1401, the share of the employed higher education graduates out of the total employed people was 27.4 percent. The share stands higher for women and urban areas than for men and rural areas. A review of the changes suggests that this indicator increased by 0.8 percent over the corresponding season in the previous year (winter, the year 1400).

Definitions and concepts

The Statistical Centre of Iran employs new international definitions and concepts based on the ICLS 1983¹ for measuring employment and unemployment in the Labour Force Survey as far as possible.

Work: This key term is used to determine the status of the economic activity of the people. The term "work" refers to the group of economic activities (mentally or physically) which are done for earning income (cash or in-kind) and its objective is to produce goods or services. Generally, the people who work are divided into two groups: self-employed, who work for themselves, and wage and salary earners, who earn money for the work they do.

Statistical period (Reference week): It refers to the second or third calendar week (Saturday to Friday) of the middle month of each season.

Employed: All people aged 15 or over who, according to the definition of work, have worked for at least one hour during the reference week or have temporarily left their job for one reason or another, are reckoned as employed. Persons who, without receiving any remuneration, work for a member of their household that is a relative (unpaid family workers); trainees who perform an activity in relation to the activity of the institute for apprenticeships during the training period, namely, they directly contribute to the production of goods or services, their activity is considered "work"; students who have worked during the reference week, according to the definition of work; and all people who are serving as a permanent and temporary cadre in the armed forces (armed forces, cadre personnel, soldiers, commissioned officers, non-commissioned officers of the military forces and the police) are considered employed.

Unemployed: The unemployed are all people aged 15 or over who have the following three criteria together: They

1. have no job during the reference week (not engaged in a wage/salary job or self-employment),
2. have been seeking jobs during the reference week and the preceding three weeks (have taken specific stages to seek paid employment or self-employment),
3. are available to work during the reference week or the following week (available for a wage/salary employment or self-employment). All people who, because of expecting to start a job in future or return to their former job, have not been seeking a job, but have had no job and have been available to work - are also considered unemployed.

Labour force (active population): is the sum of employed and unemployed persons.

Underemployment: The underemployed people are all employed people who have been present in or temporarily absent from the workplace and have worked less than 44 hours during the reference week due to economic reasons such as work recession, not finding a job with more hours, or non-work season, but have been willing and ready to do more work in the reference week.

¹ ILO, Thirteenth International Conference of Labor Statisticians (Geneva, 1983).

A Selection of Labor Force Survey Results, Winter, the Year 1401

Indicators

Economic participation rate (Economic activity rate):

The ratio of the active population (employed & unemployed) to the working age population multiplied by 100.

$$\text{Economic participation rate} = \frac{\text{Economically active population aged 15 and over}}{\text{Population aged 15 and over}} \times 100$$

Employment ratio: The ratio of the employed population to the total population at working age multiplied by 100.

$$\text{Employment ratio} = \frac{\text{Employed population aged 15 and over}}{\text{Population aged 15 and over}} \times 100$$

Unemployment rate:

The ratio of the unemployed population to the active population (employed & unemployed) multiplied by 100.

$$\text{Unemployment rate} = \frac{\text{Unemployed population aged 15 and over}}{\text{Active population aged 15 and over}} \times 100$$

Employment rate:

The ratio of the employed population to the active population (employed & unemployed) multiplied by 100.

$$\text{Employment rate} = \frac{\text{Employed population aged 15 and over}}{\text{Active population aged 15 and over}} \times 100 = 100 - \text{unemployment rate}$$

A Selection of Labor Force Survey Results, Winter, the Year 1401

Unemployment rate of the population aged 15-24:

The ratio of the unemployed population aged 15-24 to the economically active population aged 15-24 multiplied by 100.

$$\text{Unemployment rate aged 15-24} = \frac{\text{Unemployed population aged 15-24}}{\text{Economically active population aged 15-24}} \times 100$$

Unemployment rate of the population aged 18-35

The ratio of the unemployed population aged 18-35 to the economically active population aged 18-35 multiplied by 100.

$$\text{Unemployment rate aged 18-35} = \frac{\text{Unemployed population aged 18-35}}{\text{Economically active population aged 18-35}} \times 100$$

Unemployment rate of higher education graduates:

The ratio of unemployed higher education graduates to active higher education graduates multiplied by 100.

$$\text{Unemployment rate of higher education graduates} = \frac{\text{Unemployed higher education graduates}}{\text{Economically active higher education graduates}} \times 100$$

Share of unemployed higher education graduates aged 15 and over:

The ratio of unemployed higher education graduates to the total unemployed population aged 15 and over multiplied by 100.

$$\text{Share of unemployed higher education graduates aged 15 and over} = \frac{\text{Unemployed higher education graduates aged 15 and over}}{\text{Unemployed population aged 15 and over}} \times 100$$

A Selection of Labor Force Survey Results, Winter, the Year 1401

Share of employed higher education graduates aged 15 and over:

The ratio of employed higher education graduates to the total employed population aged 15 and over multiplied by 100.

Employed higher education graduates aged
15 and over

Share of employed higher education graduates aged 15 and over = $\frac{\text{Employed higher education graduates aged 15 and over}}{\text{Total employed population aged 15 and over}} \times 100$

Total employed population aged
15 and over

Underemployment share aged 15 and over:

The ratio of the underemployed population aged 15 and over to the employed population aged 15 and over multiplied by 100.

Underemployed population aged 15 and over

Underemployment rate = $\frac{\text{Underemployed population aged 15 and over}}{\text{Employed population aged 15 and over}} \times 100$

Employed population aged 15 and over
