

### *Introduction*

**B**elow you will find a history of examining prices and calculating the different related price indices in the Islamic Republic of Iran.

#### ***A. Consumer price index for goods and services in urban areas***

The National Bank of Iran first calculated the Cost of Living Index [1] in urban areas and the Wholesale Price Index for goods in the year 1315. In the year 1338, the calculation of the Cost of Living Index and the Wholesale Price Index for goods was revised due to the change of the base year. With the establishment of the Central Bank of Iran in the year 1339, the responsibility for calculating such indices was shifted to this Bank. With respect to remarkable changes in households' consumption patterns and expenditure composition, the Central Bank of Iran took the year 1348 as the base and made the second revision in the calculation of the Cost of Living Index and the Wholesale Price Index for goods. The year 1353 witnessed some changes in national economic conditions, which caused it to be selected as the new base year, and the indices calculation underwent the third revision. Considering the changes that happened in the household consumption pattern resulting from socio-economic developments after the 1357 Islamic Revolution, the year 1361 was adopted as the base, and the indices calculation was revised

again. In the year 1369, after the end of the Iran-Iraq War, which caused changes in economic conditions, a revision in the base year was considered necessary, and the Central Bank of Iran adopted the year 1369 as the new base for the calculation.

In the year 1378, the Central Bank of Iran changed the base year from the year 1369 to 1376 for calculating the price index of consumer goods and services in urban areas. Additionally, since the year 1385, this index has been calculated and disseminated using the base year 1383. Since the year 1374, the Statistical Centre of Iran has conducted a survey on the retail prices of consumer goods and services for national urban households and has published the corresponding results. During the mentioned period, according to the market conditions of consumer goods and services, changes in the consumption patterns of households, etc., and changes in the survey according to the above factors have been made so that the base year of this index has been revised from the year 1374 to the year 1381 and after that, to the years 1390, 1395, and finally to the year 1400, respectively

#### ***B. Consumer price index for goods and services of rural households***

The SCI conducted the retail price survey of certain consumer goods and services in rural areas

for the first time in the year 1353. The results of the survey used to be published in the form of the average prices of consumer goods and services in rural areas as quarterly and annual reports until the middle of the year 1357. The results of the survey for the second half of the year 1358 and the first half of the year 1359 were released as average prices and consumer price indices for rural households. Consumer price indices for goods and services for rural households were calculated and released from the year 1361 to the year 1375, with the year 1361 as the base. Moreover, the year 1374 was adopted as the base year in 1376, and the statistics for the years 1375 to 1383 were prepared and disseminated by Ostans and the entire country. From 1383 to 1391, the base year was 1381. After that, the years 1390 and 1395 were adopted as the base year, and currently, according to the latest revisions, the year 1400 has been adopted as the base for calculation.

### **C. Producer price index**

The Central Bank of the Islamic Republic of Iran started the calculation of the producer price index in the year 1369. The most important uses of the index are the early presentation of inflation trends and its application in national accounts for adjusting current prices into constant prices. The Office of Price Indices of the Statistical Centre of Iran has calculated this index since the year 1390. Currently, the information for this index is calculated quarterly and annually based on the base year 1395 and is published in the National Statistical Yearbook

### **D. Price index for goods exported and imported**

In the system of price statistics, the price indices for exported and imported goods are used for different reasons. The price index for exported goods shows the price changes in exported goods, and the price index for imported goods shows the price changes in goods supplied in the country for a specific period of time.

At the Statistical Centre of Iran, as of the year 1381, the survey of the price of exported goods to calculate the price index of exported goods was implemented via the sampling method, and its implementation continued until the year 1392, but it was postponed due to some reasons. In the year 1393, theoretical and feasibility studies of the "exported goods price index" and "imported

goods price index" surveys were put on the agenda of this Centre using the information of the Islamic Republic of Iran Customs Administration. In the year 1394, the price indices of exported and imported goods were calculated and published for the first time. These calculations were based on nationally registered information and used the base year 1390. The indices were updated quarterly and measured the value of goods in both dollars and rials from the year 1390 to the summer of the year 1399. In the year 1399, after expert reviews, the base year for the price index survey was changed to the year 1395. The time series was adjusted and updated accordingly. Currently, the base year for calculation is 1400, as per the latest revision.

### **Definitions and concepts**

**Consumer price index (CPI):** is a measure of changes in prices of a certain fixed number of goods and services consumed by households over the base year.

**Base year:** This is a certain and fixed year that is chosen according to the national economic and social conditions, and the indices in all other periods are produced based on it and compared with it.

The index for the base year is equal to 100.

**Weight:** This refers to the contribution of any single good or service to the set of goods and services subject to the indices, called "weight". In consumer price indices for goods and services, the contribution of any single good or service is equal to the proportion of expenditure spent by a household to total household expenditure. In the producer price index, the contribution of any single good or service is the proportion of the output value (or production value) of a single good or service to the total output value (or production value) of economic sectors per the base year.

**Classification of groups for goods and services:** This classification of goods and services in price indices is made according to their intrinsic nature and international classifications as well as national requirements. However, the overall bases of classifications are those recommended by the United Nations (i.e., the COICOP [1] for goods and services, HS [2] for exported and imported

goods, and ISIC Rev. 4 [3] for producers) and modified with respect to the considerations of Iran's economy.

***Durable, semi-durable and non-durable goods:***

Goods are a weighted average of durable, semi-durable, and non-durable goods. The distinction between non-durable and durable goods is based on whether the goods can be used only once or repeatedly or continuously over a period of considerably more than one year. Moreover, durables, such as motor cars, refrigerators, washing machines, and television sets, have a relatively high purchasers' price. Semi-durable goods differ from durable goods in that their expected lifetime of use, though more than one year, is often significantly shorter, their purchase prices are substantially less, and the number of purchase frequencies is higher over the year. Other goods are considered non-durable

***Fresh foods and other foods:*** Fresh foods refer to the foods that are bought more than once a month and experience more price fluctuation than other foods. Accordingly, their prices are asked three times a month (the prices of other foods are asked twice a month). This group includes red and white meat, dairy products, fresh fruits, and vegetables.

***Goods and public services:*** These refer to the goods and services for which price policies and supply are formulated and developed by the government or public sector, such as energy carriers, state medical and educational services, and the cost of fixed telephone calls.

***Urban areas:*** see Chapter 3, "Population" Definitions and concepts.

***Rural areas:*** see Chapter 3, "Population" Definitions and concepts.

***Producer price index (PPI):*** This refers to a quantity that measures the changes in the weighted average price received by producers for the production of their goods and services in the country in a given period of time (base year). The producer price index shows the trend of changes in the average price of goods and services produced within the country.

***Price index for exported commodities:*** This refers to a quantity that measures the changes in the weighted average price of products supplied from inside the country to abroad (international borders) in a certain period of time (base year). The price index of exported

goods shows the trend of price changes of exported goods and fluctuations in exchange rates.

***Price index for imported commodities:*** This refers to a quantity that measures the changes in the weighted average price of products imported from abroad into the country (international borders) in a certain period of time (base year). The price index of imported goods shows the trend of price changes in imported goods and fluctuations in exchange rates..

***Selected information***

Consumer price indices for goods and services for national households increased by 40.7 percent in the year 1402, reaching 205.1 (base year=1400) compared to the year 1401. The national household consumer price indices for two special groups, "goods" and "services," increased by 41.1% and 40.2%, respectively, compared to the year 1401. Within the "food and beverages" group, the price indices for "fats and oils", had the lowest change at 14.6%, and "meat and poultry" had the highest change at 87.0% compared to the year 1401. The "tobacco" group experienced a 42.1% rise in comparison to the previous year.

In the group of non-food goods and services, the index for the "restaurants and hotels" group had the highest change, with an increase of 59.8%, while the "communication" group had the lowest change, with an increase of 19.8%.

In the year 1402, among the Ostans of the country, the Ostan of Yazd had the highest general index of 231.1, indicating the highest increase in the price of consumer goods and services by households in this Ostan compared to the base year. The Ostan of Tehran had the lowest general price index of consumer goods and services at 194.5.

In the year 1402, urban household consumer price indices increased by 40.7 percent and stood at 204.0 compared to the previous year (base year=1400). Urban household consumer price indices for two special groups, "goods" and "services," increased by 41.2% and 40.1%, respectively, compared to the year 1401.

Consumer price indices for goods and services for rural households in the year 1402 increased by 40.6 percent compared to the previous year and stood at 211.7(base year=1400).

Consumer price indices for goods and services of rural households for two special groups, "goods" and "services," increased by 40.5 and 41.1 percent, respectively, compared to the year 1401.

In the group of "food and beverages for rural households," the highest and lowest increases are related to the "meat and poultry" group with an 83.6% increase and the "fats and oils" group with a 13.2% rise, respectively. Additionally, the "tobacco" group experienced a 41.7% increase compared to the previous year.

In the "non-food goods and services" group, the highest increase is in the "restaurants and hotels" group with a 62.1% increase, and the lowest increase is in the "communication" group with a 19.7% increase compared to the previous year.

The national producer price general index for the year 1402 increased by 41.5% compared to the year 1401 and stood at 994.4 (base year=1395).

The producer price index in the "services" sector had the highest increase with a 54.5% increase compared to the previous year, while the "manufacturing" sector had the lowest change with a 29.9% change compared to the previous year.

The general price index for exported goods (rial-based data) in the year 1402 increased by 30.4 percent and stood at 185.2 (base year=1400) compared to the year 1401. In this index, the highest increase relates to the group "machinery and mechanical appliances; electrical equipment,..." with a 65.9% rise and the "Works of art, collectors' pieces and antiques" group with a 10.7 percent rise had the lowest change in comparison with the previous year.

The general price index for imported goods in the year 1402 (rial-based data) increased by 66.2 percent and stood at 487.7 (base year=1400) compared to the year 1401. In this index, the highest increase relates to the group "Optical, photographic instruments; electrical equipment,..." with a 126.8% rise. It should be noted that "fats and oils" group had a decrease of 8.1 percent compared to the previous year.

### 22.1. CONSUMER PRICE INDICES OF GOODS AND SERVICES FOR ALL NATIONAL HOUSEHOLDS IN MAJOR GROUPS BY MONTH (1400= 100)

| Year and month    | General       |                                                                                           | Food and beverages |                                                                                           | Tobacco       |                                                                                           | Clothing and footwear |                                                                                           |
